PROFILE

Software Engineer with 2+ years of hands-on experience in C# .NET, TypeScript and Python, building cloud-native production systems on Microsoft Azure. I work across the full stack from Azure Functions APIs and SQL databases to React frontends with strong skills in Docker, CI/CD automation and secure API design. I follow an AI-native way of working: I write specifications first, use AI tools like Cursor and Claude to build fast, then review and test everything carefully. I take full ownership from architecture to live cloud deployment, and I enjoy turning complex problems into clear, working solutions.

AREA OF EXPERTISE

Python · C# · .NET · TypeScript · React · NextJs · Microsoft Azure · Azure DevOps · Generative AI · LLM Orchestration · RAG Architectures · MLOps & LLMops · CI/CD Pipelines · REST APIs & Microservices · Docker · Observability & Logging · Spec-Driven Development · Git · Technical Leadership · Test Automation

PROFESSIONAL EXPERIENCE

Full Stack Software Developer

Lahti - Finland
04 / 2026 - present

Peikko Finland Oy

- Building enterprise-grade cloud-native solutions on Microsoft Azure using C# .NET and React/TypeScript owning architecture decisions with focus on scalability, security and reliability
- Designing and integrating RESTful APIs and microservices across complex enterprise backend systems with engineering rigor and long-term maintainability
- Managing CI/CD pipelines via Azure DevOps applying continuous deployment, infrastructure automation and observability practices
- Consulting internally on AI tooling integration identifying opportunities to improve productivity through intelligent automation

Ai & Automation Developer

Lahti - Finland
12 / 2025 - 04 / 2026

Kimbtron Oy

- Designed and orchestrated multi-step agentic workflows using n8n tool-calling agents, LLM orchestration, prompt engineering and multi-agent automation from PoC to production
- Built and deployed AI-native applications integrating generative AI into client-facing products maintaining model lifecycle, observability and cost transparency across every deployment
- Identified AI use cases in client business processes and translated them into production-ready implementations combining technical depth with business understanding
- Established MLOps practices version control, testing strategies, schema validation and monitoring ensuring production stability and traceability

EDUCATION

Bachelors of engineering industrial information and technology

Lahti - Finland
08 / 2025 - present

LAB University of Applied Sciences

- Relevant Courses: Programming, Algorithms, Data Structures, Object Oriented Programming Programming, Software Engineering, Embedded system, Devops, Data Pipelines

Bachelors of information and technology - Cross-Institutional Courses

Helsinki - Finland
08 / 2025 - present

Metropolia University of Applied Sciences

- Relevant Courses: React.js Fundamentals, Introduction to Artificial Intelligence

PROJECTS

AI Agent Observability Platform

Lahti - Finland

Jun 2026

Independent Project

- Built a complete observability system that tracks AI coding tool usage (cost, tokens, sessions, activity) across four layers: a TypeScript collector, a C# .NET 8 Azure Functions ingest API, an Azure SQL database, and a React dashboard with live charts and time-range filtering
- Designed spec-first wrote full SPEC and DESIGN documents before coding then built with AI-assisted development and careful manual review, finding and fixing real bugs including a silent data-loss issue in batch inserts
- Secured the ingest API with JWT bearer authentication (HS256) and made event ingestion idempotent using database unique constraints with per-row duplicate handling
- Runs locally with a single Docker Compose command (multi-stage builds, health-gated startup, nginx reverse proxy) and deployed live to Azure: Functions, serverless Azure SQL, and Static Web Apps, with a path-filtered GitHub Actions CI pipeline
- Live demo → <https://ashy-stone-03ea7b210.7.azurestaticapps.net>
- Source code → <https://github.com/HassanAmir454/react-dashboard>

ReviewOS - AI-Powered GitHub PR Review Dashboard

Lahti - Finland

Oct 2025 – Nov 2025

Independent Project

- Designed and built a production-grade AI platform using Next.js 14, TypeScript, FastAPI, PostgreSQL, Redis and WebSockets delivering live GenAI feedback streaming under concurrent enterprise load
- Implemented full MLOps and LLMOps practices model lifecycle management, CI/CD pipelines, observability layer, schema validation, cost controls and graceful degradation built in from day one
- Engineered scalable microservices architecture with Docker and GitHub OAuth every AI agent run logged, monitored and queryable with full governance and traceability
- Demonstrated end-to-end architectural ownership from PoC through production understanding security, compliance, scalability and cost transparency requirements of enterprise GenAI systems
- Live demo → reviewosapp.vercel.app
- Source code <https://github.com/HassanAmir454/reviewos>

COURSES

Python for Data Science, AI & Development

2026

Coursea

- Learn Python basics like syntax, variables, data types, and string operations, then apply logic using conditions, loops, functions, and classes. Use libraries like Pandas and NumPy in Jupyter Notebooks, and work with web data through APIs (requests) and web scraping (BeautifulSoup).

SKILLS

Strong communication
Time management
Independent leadership
Creative problem-solving
Cross-cultural teamwork

LANGUAGE

English - Professional (fluent)
Finnish - B1
